

# Garagy

FIND · BOOK · TRACK

## Rebrand & Product Strategy

A new name and identity for the “CarCare” graduation project — with the market gap, a sharpened MVP, and a backend recommendation: Laravel-Filament vs Firebase vs Supabase.

# From “CarCare” to a brand that owns trust on the map

CarCare is a strong product with a generic, crowded name. The SRS describes something genuinely differentiated — a **map-first marketplace that verifies who you can trust with your car** — yet “CarCare” signals none of that and collides with dozens of existing services. This report gives you a new name and identity, locates the real gap in Egypt, sharpens the MVP, and recommends a backend.

## The recommendation in one line

**Name:** **Garagy** (جراجي) — “your garage,” in your pocket.

**Identity:** a verified-pin + car mark; teal = trust, amber = the verified check.

**Wedge:** map-first *verified* discovery + booking + a per-car memory.

**Backend:** Supabase backbone (PostGIS) + a Laravel-Filament web admin; Firebase for push only.

## Why it matters

Egypt has ~6M cars and a ~\$1.5–1.6B aftermarket heading to ~\$2.3–2.5B by 2030, served by ~35,000 mostly-offline workshops. Today’s apps each own one lane — parts, car-wash, roadside. **No one owns trusted, map-first discovery + booking + maintenance memory.** That is the opening.

## What’s inside

| # | Section      | What you get                                                                                  |
|---|--------------|-----------------------------------------------------------------------------------------------|
| 1 | New name     | 9 names across 3 styles, a diligence checklist, and a recommended primary + two runner-ups.   |
| 2 | New logo     | Three finished directions (color, reverse, app icon), a palette and type — ready to use.      |
| 3 | Market & gap | Egypt sizing, a competitor map, and the precise unmet job-to-be-done.                         |
| 4 | Features     | A structured brainstorm: discovery, booking, “car-memory,” trust and growth layers.           |
| 5 | MVP          | A build-in-13-weeks scope — what’s in, what’s out, and the success metric.                    |
| 6 | Backend      | Laravel-Filament vs Firebase vs Supabase — scored, with a clear pick for <i>this</i> product. |

This document is product/brand strategy and technical opinion, not legal or financial advice. Clear any trademark, domain and app-store name with a professional before filing.

## A name that is ownable, bilingual, and clearly “cars”

“CarCare” has three problems: it is descriptive (hard to trademark or rank in app stores), it is already used by detailing shops and apps worldwide, and it under-sells the product. A good name here works in Egyptian Arabic and English, is short and brandable, and hints at the product’s soul — your car, looked after, nearby.

### Style A — Invented / brandable (most ownable; best app-store names)

#### Garagy • جراجي recommended

COINED FROM “GARAGE” + THE POSSESSIVE “-Y”

Reads instantly as cars in both languages (Egyptians already say *garage*/جراج), means “my garage,” and maps onto the in-app **Garage** where your cars and history live. Short, warm, trademark-friendly.

#### Revvo • ريفو

FROM THE ENGINE “REV” + AN OPEN “-O”

Energetic and modern; great for motion-led branding and a younger audience. Diligence: an unrelated tyre brand uses “Revvo” in some markets.

#### Motary • موتري

“MOTOR” + THE POSSESSIVE “-Y”

Tech-forward and platform-like; a touch more corporate than Garagy.

### Style B — Arabic-rooted, bilingual (local resonance, trust-led)

#### Sanad • سَنَد

ARABIC FOR “TRUSTED SUPPORT / BACKING”

Lands the whole thesis — *trust* — in one word: the backup you lean on for your car. Premium across B2C and B2B. Diligence: “Sanad” is common; check the app/software class.

#### Maalem • مَعْلَم

DOUBLE MEANING: “LANDMARK” + “THE MASTER”

Perfect for Egypt: a *maalem* is a point on the map *and* *el-maallem* — the master mechanic everyone trusts. Map + craft in one word.

#### Sanaya • صنايعي

FROM SAN‘A — “THE SKILLED CRAFTSMAN”

Warm and local; about the *people* who fix your car. Pairs well with a community angle.

## Style C — English descriptive (instantly clear; harder to own)

### MotorMap

"MOTOR" + "MAP"

Says the strategy out loud — the map is the product. Clear and confident, but descriptive names are harder to trademark.

### AutoPin

"AUTO" + MAP "PIN"

Clean and modern; the pin ties to map-first discovery and makes a simple icon.

### PitStop

RACING METAPHOR FOR A QUICK EXPERT SERVICE

Friendly and familiar, but widely used — the least ownable here.

## Recommendation

**Primary: Garagy (جراجي).** The rare name that is brandable *and* instantly understood in both languages, is ownable, and reinforces the product's retention engine — your personal **Garage**. Tagline "**Find · Book · Track**" (اعرف · احجز · تابع); trust line "*your trusted garage, on the map*" (جراجك الموثوق على الخريطة).

**Runner-ups: Sanad** for a trust-first, premium positioning; **MotorMap** for maximum clarity over brandability.

## Before you commit — a 6-point diligence checklist

| Check           | What to do                                                                                            |
|-----------------|-------------------------------------------------------------------------------------------------------|
| Egypt trademark | Search the Egyptian trademark registry in software & advertising classes (Nice 9, 35, 42).            |
| App-store names | Confirm the exact name is free on Apple App Store & Google Play, plus a clean developer display name. |
| Domains         | Target garagy.app / garagy.io / getgaragy.com and .eg if possible; avoid hyphens.                     |
| Social handles  | @garagy on Instagram / TikTok / X / Facebook — important for an Egyptian consumer launch.             |
| Arabic reading  | Pressure-test جراجي with non-technical drivers — does it read clearly and positively?                 |
| Collision scan  | Google + store search for near-identical automotive names before filing.                              |

## One idea, three directions — all built around the verified check

Every mark below keeps your current DNA (teal + a check) but makes it crisp and scalable. The single accent is amber — the **“verified” check**, which is also the product’s core promise. Pick one; each ships as a colour mark, a reverse (white) mark, a horizontal lock-up, and an app icon.

### A · Pin-Car

Map-first. A location pin holds the car; an amber check = verified.

**Recommended.**

### B · Gauge-G

Minimal monogram / car-health gauge. The most abstract, most “tech”.

### C · Care roundel

Closest refresh of today’s logo — the car cradled by caring hands.

### A — app icon & reverse

White on the brand gradient.

### B — app icon & reverse

White on the brand gradient.

### C — app icon & reverse

White on the brand gradient.

**Garagy**  
FIND · BOOK · TRACK

**Primary horizontal lock-up** · wordmark set in Poppins; clear-space = the height of the pin on all sides.

## Colour palette

Teal carries trust and calm (and keeps continuity with the old logo). Amber is used *only* for the verified check and primary actions, so it stays meaningful. Ink for text, soft teal-greys for surfaces.

## Typography

**Latin — Poppins.** Geometric, friendly, modern; used for the wordmark, headings and UI.

**Arabic — Cairo or Tajawal.** The natural geometric companions to Poppins, with clean RTL forms for جراجي and the bilingual UI.

(This document renders Arabic in a fallback face; ship the app and brand assets in Cairo/Tajawal.)

### Mark = pin + car + check.

Don't recolour the amber check, stretch the mark, or add effects. Minimum icon size 20 px; keep the clear-space.

## A big, offline market that nobody has organised by trust

Egypt's car-care market is large, growing, and overwhelmingly informal. The opportunity is not "another car app" — it is becoming the trusted layer between millions of owners and tens of thousands of workshops.

**~6 million**

registered passenger cars (≈10.4M vehicles, +4.7% YoY)

**\$1.5–1.6B**

automotive aftermarket (2024) → ~\$2.3–2.5B by 2030

**~35,000**

workshops & service providers, mostly offline

**\$600+**

average spend per car, per year

### The competitor map — everyone owns one lane

| Player                      | Lane                    | What they do                                                                            | Gap they leave                                              |
|-----------------------------|-------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <b>Mtor</b>                 | Auto-parts supply (B2B) | Parts marketplace + mechanic app; 70k+ orders, 2,500+ Cairo workshops; \$2.8M pre-seed. | Not consumer discovery or booking; no map for owners.       |
| <b>Drop</b>                 | On-demand wash & repair | Home car-wash, repair/ customisation booking, plus social/FM features.                  | Service-led, not trust-ranked discovery; no per-car memory. |
| <b>Mismar</b>               | Service aggregator      | Connects owners to providers for maintenance, repairs, parts.                           | No map-first, verified, vehicle-aware ranking.              |
| <b>MAYDAY • Beliaa</b>      | Roadside assistance     | Real-time roadside help; Beliaa adds reminders + traffic.                               | Emergencies only — not planned maintenance or booking.      |
| <b>Petromin • Nacita</b>    | Single service chains   | Own-brand maintenance, mobile units.                                                    | One provider — not an open, comparable marketplace.         |
| <b>Yellow Pages, Google</b> | Static listings         |                                                                                         | No verification, no fair pricing, no booking, no memory.    |

Names,  
phones, some  
reviews.

## The unmet job-to-be-done

*"I don't know which workshop near me I can **trust** with **my specific car**, at a fair price — and I have no record of what's already been done to it."*

Three things compound that pain in Egypt: **trust** (is this mechanic honest and competent?), **fit** (does he know *my* make/model and have the right parts?), and **memory** (no service history, so resale and planning suffer). Garagy answers all three with one wedge.

## Positioning

**For** car owners in Egypt who want maintenance without the guesswork, **Garagy** is the **map-first app that shows verified service centres, fair prices and live booking — and remembers your car's history**. Unlike parts apps, car-wash apps or static listings, Garagy ranks by *trust* and *fit for your car*, and turns one-off visits into an ongoing record.

## Where Garagy wins (feature presence across the field)

| Capability                                              | Garagy | Mtor | Drop   | Mismar | Roadside apps |
|---------------------------------------------------------|--------|------|--------|--------|---------------|
| Map-first <i>verified</i> discovery                     | strong | weak | weak   | ok     | weak          |
| 3-tier trust badges (Authorized / Verified / Community) | strong | weak | weak   | weak   | weak          |
| Vehicle-aware matching (your make/model)                | strong | ok   | weak   | weak   | weak          |
| Slot booking + status tracking                          | strong | weak | strong | ok     | ok            |
| Per-car maintenance & expense memory                    | strong | weak | weak   | weak   | weak          |

## Five layers — a wedge now, a moat later

The features below are organised so the early layers create the wedge (discovery + booking), the middle layer creates retention (car memory), and the trust layer creates the moat. Tags show what belongs in MVP versus later phases.

### ① Discovery & map — the wedge

Treat the map as a **Smart Auto-Map**, not just pins. Categorise beyond “service centres”: periodic maintenance, electrical, bodywork & paint, oil change, tyres & batteries, pre-purchase inspection, car wash, EV charging, roadside. Smart filters: **verified only** **open now** **nearest** **cheapest** **top-rated** **fits my car** **accepts booking**. Center profiles carry a **6-axis rating** (honesty, quality, speed, price, cleanliness, punctuality) and **car-specific reviews** (“great on Toyota Corolla,” “strong on automatic gearboxes”). A later *heatmap* shows where good, cheap, or under-served areas are. **MVP: map, filters, profiles, reviews** **Phase 2+: heatmap, smart ranking**

### ② Booking & operations — the two-sided engine

Book a slot straight from a pin with a 10-minute hold to prevent double-booking. Owners track status (received → in progress → completed → invoiced); centres accept/assign a mechanic/complete, and an invoice is generated automatically. Replace in-app chat with one-tap call + SMS for MVP. **MVP: book, hold, status, invoice** **Phase 2: chat, rescheduling, promotions**

### ③ Car memory — the retention engine

This is what turns a directory into a habit. A multi-car **Garage**; maintenance auto-logged from bookings plus manual entries; **smart reminders** (mileage- and time-based); a parts-lifetime guide; a **Car Health Score**; an expense & fuel tracker (cost-per-km, monthly spend); a document vault (licence, insurance, invoices); and an exportable history for resale.

**MVP: garage, auto-log, basic reminders**

**Phase 2: health score, expenses, fuel, documents**

### ④ Trust & safety — the moat

Three explicit badges, never blurred: **Authorized** (endorsed by a brand/dealer), **Verified** (checked by the Garagy team via documents), **Community-Trusted** (earned through real ratings). Backed by an admin verification pipeline, dispute resolution, and a money-back guarantee. The verification *data* compounds and is hard for a fast-follower to copy.

**MVP: badges, verification queue, disputes**

### ⑤ Growth, loyalty & the “wow” layer — later

Per-centre offers and coupons, re-book in two taps, favourites/“my trusted mechanic,” and referrals. Then the headline extras: **roadside & emergency dispatch** with live ETA; a **dashboard warning-light scanner** (photo → AI explains the light); a **damage scanner** (photo → repair estimate); OBD-II integration; and a **parts marketplace** (where you could partner with — or compete against — Mtor). **Phase 3–5: roadside, AI scanners, OBD, parts**

## The smallest thing that proves the wedge — in ~13 weeks

Your SRS already scopes a 13-week, 5-engineer MVP on three Flutter surfaces. The sharpening below keeps the map-first wedge intact while removing everything that adds risk without proving the thesis.

### ✓ In the MVP

- **One city** (Greater Cairo) with 50–100 **hand-verified** centres seeded by your team.
- **Map-first discovery**: pins, smart filters, search, list view, directions/call.
- **Verified centre profiles**: badges, services, transparent prices, 6-axis reviews.
- **Booking happy-path**: pick service → slot → confirm, with a 10-min hold + status tracking.
- **Cash-on-service first** (no in-app card payments yet — see below).
- **Garage + auto-logged maintenance** + basic mileage/time reminders.
- **B2B app**: onboarding + document upload, dashboard, accept/reject, mark complete, reply to reviews.
- **Admin**: verification queue + manual dispute handling (a Filament web panel — see §6).

### ✗ Deliberately out (Phase 2+)

- In-app card payments, automated payouts, commission engine.
- Customer CRM, promotions engine, business tiers/subscriptions.
- Deep expense/fuel analytics, car health score, document vault.
- Roadside/emergency dispatch & live ETA.
- AI scanners (warning-light, damage), OBD-II.
- Parts marketplace, community, multi-city, web clients.
- In-app chat (use call + SMS instead).

## Two decisions that de-risk the launch

**1 • Cash-first.** Your SRS lists “cash-only vs in-app payment” as an open question. For MVP, start *cash-on-service*. It removes PCI scope, gateway integration and payout logic from the critical path, and it matches how most Egyptian workshops already operate. Turn on in-app payments in Phase 2 with a *local* gateway (see §6).

**2 • Seed trust manually.** Don’t wait for organic supply. Pull places from a maps API, then have your team verify and enrich the first 50–100 centres (badges, prices, photos) and open self-serve onboarding alongside. Trust is the product; curate it by hand at first.

## North-star & success metrics

**North-star:** *completed, verified bookings per month in the launch city.*

Launch targets (from the SRS, kept): **50+ verified centres, 1,000+ active owners, 500+ completed bookings / month**. Add one retention proof: **≥30% of owners log a second maintenance event** within 60 days — evidence the “memory” loop works.

## Laravel-Filament vs Firebase vs Supabase

The honest answer depends less on personal preference than on what *this* product and *this* team demand. Five forces decide it: native **geospatial** (a map-first app lives or dies on “centres near me”), **realtime**, **time-to-MVP with 5 Flutter engineers and no backend specialist**, a strong **admin back-office**, and **local payments**.

| What the product needs                              | Supabase                                        | Firebase                                             | Laravel + Blade + Filament                                  |
|-----------------------------------------------------|-------------------------------------------------|------------------------------------------------------|-------------------------------------------------------------|
| Geospatial “centres within X km” (map-first core)   | <strong> · native</strong><br><b>PostGIS</b>    | <strong> ·</strong><br>geohash<br>work-<br>arounds   | <strong> ·</strong><br>PostGIS/<br>MySQL, you<br>build it   |
| Realtime (new booking → live dashboard)             | <strong> · built-in</strong><br>Realtime        | <strong> · its</strong><br>core<br>strength          | <strong> · add</strong><br>Reverb/<br>Pusher, self-<br>host |
| Auth incl. phone-OTP, storage, functions            | <strong> ·</strong><br>Auth+Storage+Edge<br>Fns | <strong> ·</strong><br>best phone-<br>OTP            | <strong> · build</strong><br>with a<br>provider             |
| Time-to-MVP (5 Flutter devs, no backend specialist) | <strong> ·</strong>                             | <strong> ·</strong>                                  | <strong> ·</strong><br>needs a<br>backend dev               |
| Admin back-office (verify, disputes, payouts)       | <strong> · Studio + a</strong><br>small app     | <strong> ·</strong><br>console only                  | <strong> ·</strong><br><b>Filament is<br/>excellent</b>     |
| Local payments (Paymob/Fawry) & webhooks            | <strong> · via Edge</strong><br>Functions       | <strong> · via</strong><br>Cloud<br>Functions        | <strong> ·</strong><br>most direct<br>server-side           |
| Cost, portability, vendor lock-in                   | <strong> · open</strong><br>Postgres            | <strong> ·</strong><br>NoSQL lock-<br>in, read costs | <strong> · self-</strong><br>host, but you<br>run ops       |
| Operational / DevOps burden                         | <strong> · managed</strong>                     | <strong> ·</strong><br>managed                       | <strong> · you</strong><br>operate<br>everything            |
| Hiring in Egypt (talent pool)                       | <strong> ·</strong>                             | <strong> ·</strong>                                  | <strong> ·</strong><br>huge PHP/<br>Laravel pool            |

### Recommendation

**Use Supabase as the backbone, and add a Laravel + Filament web admin on the same database. Use Firebase only for push (FCM).**

Supabase wins the two things that define this product — **native PostGIS geo** and **built-in realtime** — and gets five Flutter engineers to a working MVP fastest, with no backend specialist and no vendor lock-in (it's just Postgres). You don't lose Filament: point a thin Laravel app at the same Supabase Postgres and you get a **polished web back-office** (verification queue, disputes, payouts, content & catalogue moderation) plus a clean home for server-side **local-payment** webhooks later — without hand-building the entire mobile API.

### Mobile apps

Flutter × 3 surfaces →  
Supabase (Postgres + PostGIS, Auth, Realtime, Storage, Edge Functions). FCM for push.

### Web back-office

Laravel + Filament on the *same* Postgres: verification, disputes, payouts, moderation, ops dashboards, payment webhooks.

### Why not Firebase-primary

Weak native geo is disqualifying for a map-*first* product; NoSQL modelling + cost/lock-in add long-term drag.

## When full-custom Laravel (no Baas) is the right call instead

Choose a fully custom Laravel API if **(a)** you can add at least one capable backend engineer, **(b)** you need tight server-side control of local payment gateways and data residency from day one, or **(c)** you're willing to trade MVP speed for total control. Note that *Blade* renders server-side HTML, so it matters for the Filament/web admin — your Flutter apps consume JSON regardless. For a 5-Flutter-engineer, 13-week MVP, full-custom is the slowest path; it becomes attractive *after* product-market fit.

### One correction to carry into build: payments

The SRS assumes Stripe, but Stripe has limited availability in Egypt. Plan for a local gateway — **Paymob, Fawry, or Kashier** — integrated server-side (Edge Function or the Laravel admin) when you switch on in-app payments in Phase 2. Cash-on-service in MVP sidesteps this entirely.

## Sources & notes

Market figures and the competitor scan draw on the following (accessed June 2026). Figures vary by source and method; ranges are given where estimates differ.

- TechCrunch — “Egypt’s Mtor nabs \$2.8M pre-seed for its online auto parts marketplace.”
- Disrupt Africa — “Egyptian car parts marketplace Mtor raises \$2.8m pre-seed funding.”
- StartupList Africa — Automotive & Mobile-Apps startups in Egypt (FriendlyM, MAYDAY, Beliaa, Tawfiqia).
- Drop (drop-eg.com) — all-in-one car app: wash, repairs, booking.
- Mismar (mismarapp.com) / Crunchbase — car-owner ↔ service-provider platform.
- TechSci Research & GMI Research — Egypt automotive aftermarket size & forecast (≈\$1.5–1.6B 2024 → ≈\$2.3–2.5B by 2030–32).
- Vehicle-fleet figures — ~6M registered cars / ~10.4M vehicles (2024, +4.7% YoY).
- Source SRS & supporting docs: SRS\_CarCare\_Comprehensive.pdf; CarCare App Plan / Flow / Extra-Features / Map-Feature-Focus.

Technical claims about Supabase (PostGIS, Realtime, Edge Functions), Firebase (Firestore geo limits, FCM), and Laravel (Reverb, Filament, Blade) reflect general platform capabilities as of mid-2026 and should be re-checked against current docs at build time.

— end of report · Garagy (working name) —
